The most remarkable trait in its character is the practice it has of dropping its eggs into the nests of other birds to be hatched by them, and abandoning its progeny to the care of strangers. It has never been known to drop more than one egg into the same nest. It is migratory, spending its winters regularly in the lower parts of North and South Carolina and Georgia, and appearing in Pennsylvania about the 5th of March. These birds often frequent corn and rice fields in company with the red-winged tropicbirds, but are more commonly found accompanying the cattle, feeding on the seeds, worms, &c., which they pick up amongst the fodder, and from the excrement of the cattle, which they scratch up for this purpose.

This fluid or virus is capable of communicating genuine cow-pox to the human subject, and of conferring, in a great majority of instances, a complete and permanent security against small-pox. The discovery of this great boon

to humanity, by which one of its greatest scourges may yet be extinguished, was due to Dr Jenner's recognition of the fact that milkmaids, whose coarse hands had been inoculated by the vaccine virus, were exempt from small-pox. This immunity seems to have been long known to the class of persons whose occupation was to work among cows. The disease called *grease*, in the horse's heel, is said to possess the same virtue. The shells used as currency occur principally in the Philippine Islands. They vary in value in different localities. In India 5000 to 7000 are equal to a rupee or 2s., while in the interior of Africa 200 are worth 8d. The name is also given to other shells of the genus *Cyprina*.

It is a pretty bird, the upper part of the body being elegantly mottled with darkish brown, ashen, and warm chestnut tints. It weighs about 6 oz., and is 10 inches long. The most common of the many varied forms consists of a vertical revolving shaft, with an arm or jib, projecting upwards at an angle of from 40° to 60° from the shaft. At the upper extremity of the jib is a fixed pulley, over which is passed one end of the rope or chain to receive the weight, the other end being made fast to a cylinder fitted with a wheel and pinion, by means of which the weight can be raised to the required height. By the revolving motion of the vertical shaft the weight can be placed in any spot within the sweep of the jib. Cricket (krik'et), *n.* [A. Sax. *eric*, a staff, crutch.] A favourite open-air game played with bats, balls, and wickets, long peculiar to England, but now popular throughout the British Empire and in the United States. It is played generally by two opposite sets or sides of players, generally numbering eleven players each. Two wickets of three stumps each are pitched facing each other at a distance of about 22 yards apart. On the top of each set of stumps are placed two small pieces of wood called balls. After the rival sides have tossed for the choice of either taking the bat or fielding, two men are sent to the wickets bat in hand. The opposite or fielding side are all simultaneously engaged; one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket, where his coadjutor (the wicket-keeper) stands ready to catch the ball should it pass near him; the other fielders are placed in such parts of the field as is judged most favourable for stopping the ball after it has been struck by the batsman or missed by the wicket-keeper. It is the object of the batsman to prevent the ball delivered by the bowler reaching his wicket either by merely stopping it with his bat or by driving it away to a distant part of the field. Should the ball be driven any distance the two batsmen run across and exchange wickets, and continue to do so as long as there is no risk in being 'run out,' that is, of having the stumps struck by the ball while they are out of their position near the wickets. Each time the batsmen run between the wickets is counted as a 'run,' and is marked to the credit of the striker of the ball. If the batsman allows the ball to carry away a ball or a stump, if he knocks down any part of his own wicket, if any part of his person stops a ball that would have otherwise reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is 'out,' that is, he gives up his bat to one of his own side, and so the game goes on until all the men have played and been put out. This constitutes what is called an 'innings.' The off-side now become the on-side and try to defend their wickets and make runs as their rivals did. Generally after two innings each have been played by the contestants the game comes to an end, that side being the victors who can score the greatest number of runs. A rude form of the game is known to have been played in the fourteenth century; in 1817 it had so developed that very little alteration has been since introduced.

All men are *sinful*, but all men are not *criminal*. *Wicked* is far stronger than *sinful*, and designates one who sins wilfully and designedly. It refers both to persons and acts, as well as to thoughts tending to result in acts. A *wicked* man commits mischief, because he takes pleasure in doing ill, as in injuring his neighbour. In some—the sandhopper, woodlouse, &c.—the head is partially distinct from the thorax. The Crustacea breathe by branchiæ or gills, or by membranous vesicles, or by the general surface; and the body is composed of a series of rings more or less distinct. They possess the faculty of reproducing lost parts in an eminent degree. They have a tegumentary or outward, calcareous skeleton, in nature obviously different from the internal one of the vertebrata; it consists of a great number of distinct pieces connected together by portions of the epidermic envelope, just as among the higher animals certain bones are connected together by cartilages. Several species, if not all, moult or cast these outer skeletons or shells in the progress of growth; this is the case with crabs, crayfish, &c. They are divided into sections, the Podophthalmata or stalked-eyed, the Edephthal-mata or sessile-eyed, the Cirripedia, Cope-poda, Ostracoda, Xiphopoda, Xiphosura.

Hence, in a collective sense, all articles, as decanters, cruets, &c., made of this material. — 3. The glass of a watch-case. 4. It is doubly convex, but the posterior segment which is received into the vitreous humour, is more convex than the anterior. The central part is more dense and firm than the exterior parts, and is made up of concentric lamellae. It is of high refracting power, and serves to produce that refraction of the rays of light which is necessary to cause them to meet in the retina, and form a perfect image there.

Crystalline (kris'tal-in), *n.* 1. A crystallized rock, or one only partially crystallized, as granite. — 2. In *chem.* an old name for aniline.

Crystallization (kris'tal-iz-ā'shon), *n.* 1. The act or process by which the parts of a solid body, separated by the intervention of a fluid or by fusion, again coalesce or unite, and form a solid body. If the process is slow and undisturbed, the particles assume a regular arrangement, each substance taking a determinate and regular form, according to its natural laws; but if the process is rapid or disturbed, the substance takes an irregular form. This process is the effect of refrigeration or evaporation. — 2. The mass or body formed by the process of crystallizing. — *Alternate crystallization*, a species of crystallization which takes place when several crystallizable substances, which have little affinity for each other, are present in the same solution. The substance which is largest in quantity, and least soluble, crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution. — *Water of crystallization*. See under WATER.

Crystallography (kris-tal-og'ra-fī), *n.* [*Gr. krystallos*, crystal, and *graphē*, description.] 1. The doctrine or science of crystallization, teaching the principles of the process, and the forms and structure of crystals. The form of any solid may be determined by referring it to three rectilinear axes, intersecting one another in a single point. In some systems of crystallography, however, it is found more convenient to refer the forms of the crystals to four axes. The following are the generally adopted systems:—

(a) *Monometric*, three rectangular axes all of equal length. (b) *Dimetric*, three rectangular axes, two of equal, the third of different length. (c) *Hexagonal*, four axes, three of equal length, in the same plane, and inclined to each other at an angle of 60°; the fourth of different length, and at right angles to the plane of the other three. (d) *Trimetric* or *rhombic*, three rectangular axes of unequal lengths. (e) *Monoclinic*, three axes, two at right angles to each other, the third perpendicular to one and oblique to the other. (f) *Diclinal*, three axes, two at right angles, the third oblique to both. (g) *Triclinic*, three axes, all oblique to each other. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals. — 2. — *Curse of Scotland*, in card-playing, the nine of diamonds. Various hypotheses have been set up as to the origin of this phrase; as, that it was the card on which the 'Butcher Duke' wrote a cruel order after Culloden; but the phrase was in use before; that it is a corruption of *cross of Scotland*, the nine diamonds being arranged somewhat like a St. Andrew's cross; that, in the game of Pope Joan, the nine of diamonds is the *Pope*, of whom the Scotch have an especial horror; that a cross of lozenges, like the nine of diamonds, formed the arms of Colonel Parker, who commanded with great severity in Scotland, after the death of Charles I.; also (and this is most probably the true explanation), that it represented the heraldic bearings of the Earl of Stair, who was defeated for his share in the massacre of Glencoe. — *SYN.* Malediction, execration, ban, anathema, excommunication, affliction, torment.

Curse (kér), *n.* [A form of O. E. *kerse*, a cress, A. Sax. *kerse*. 'Wisdom and wit now is not worth a kerse.' *Piers Plowman*.] A word only used in the phrase, 'I don't care a curse.' It is unnecessary to say that the meaning now attached to the phrase is much coarser.

went to be carried into council. It was also a mark of distinction for doctors, canons, prebends, canons, and others, who were from this circumstance called *curial magistrates*. Curvature (kū-rvā-tū), *a.* [L. *curvatura*. See CURVE.] A bending in a regular form, the continual bending of a line from a rectilinear direction. The curvature of a line is the peculiar manner of its bending or flexure, by which it becomes a curve of such and such peculiar properties. Thus the curvature of a circle is such, that every point in the circumference is equally distant from a point within called the centre, and so the curvature of the same circle is everywhere the same, but the curvature in all other curves is continually varying. — *Circles of curvature*, or *circles of the same curvature*, a circle which touches a curve in a point, so that no other circle touching it in the same point can pass between it and the curve. — *Radius of curvature*, the radius of the circle of curvature. — *Double curvature*, a term applied to the curvature of a line which twists, so that all the parts of it do not lie in the same plane, as the rhomb line or the loxodromic curve.

A curve line is that which is neither a straight line nor composed of straight lines.

Curve (kūrv), *a.* 1. A bending in a regular form and without angles, that which is bent without angles, a flexure. — 2. In poem, a line which may be cut by a right line in more points than one; a line which changes its direction at every point, a line in which no three consecutive points lie in the same direction. The doctrine of curves and of the figures and solids generated from them constitutes what is called the higher geometry, and forms one of the most interesting and important branches of mathematical science. Curve lines are distinguished into algebraical or geometrical, and transcendental or mechanical. The varieties of curves are innumerable, that is, they have different degrees of bending or curvature. The curves most generally referred to, besides the circle, are the ellipse, the parabola, and the hyperbola, to which may be added the cycloid. — *Algebraic curves*, those in which the relation between the abscissa and the ordinate is expressed by an algebraic equation, called the equation of the curve. — *Transcendental curves*, those in which the relation between the abscissa and the ordinate is not expressed by an algebraic, but by a differential equation. — *Algebraic curves of the first order*, those of which the equation consists of two dimensions, as the circle, ellipse, parabola, and hyperbola. — *Algebraic curves of the second order*, those whose equation rises to the third degree, and so on. Curves are said to be of the same species, in which the motion of the describing point is regulated by the same mathematical law. — *Geometrical curves* are such as do not admit of being expressed analytically, and which have no known equation. — *Arithmetical and syncretical curves*, in poet. terms applied to the elevations and depressions of undulating surfaces of strains. See ARTIFICIAL and SYNCRETICAL.

Cycloid (si-kioid), *n.* [Gr *kyklos*, circle, and *eidos*, form.] 1. A curve generated by a point in the plane of a circle when the circle is rolled along a straight line, and kept always in the same plane. The genesis of the common cycloid may be conceived by imagining a nail in the circumference of a wheel, the line which the nail describes in the air while the wheel revolves in a right line is the cycloid. The cycloid is the curve of swiftest descent, that is, a heavy body descending by the force of its own gravity will move from one point of this curve to any other point in less time than it will take to move in any other curve which can be drawn between these points. Also, a body falls through any arc of an inverted cycloid in the same time whether the arc be great or small. In the figure let the circle BDA, of which the diameter is A B, make one revolution upon the straight line A B A, equal in length to its circumference, then the curved line A C A, traced out by that point of

the circle which was in contact with the point A in the straight line when the circle began to revolve, is called a cycloid. The following are some of its properties. — If the generating circle be placed in the middle of the cycloid, its diameter coinciding with the cycloid's axis A B, and from any point C in the curve there be drawn the tangent C F, the ordinate O F perpendicular to the axis, and the chord A D be drawn from the upper extremity of the diameter to the point where the ordinate cuts the circle, then O D = the circular

Cyclones occur most frequently in those parts of the world subject to monsoons, and at the seasons when the monsoons are changing, and seem to be eddies formed by the meeting of opposing currents of air which accounts for the fact that they revolve in opposite directions in the two hemispheres. In the southern with, and in the northern against, the hands of a watch in consequence of which, and the progression of the centre, the strength of the storm in the northern hemisphere is greater on the south of the line of progression and weaker on the north than it would be if the centre were stationary, the case being reversed in the southern hemisphere. Such localities would be the natural dwelling-places of the earliest tribes, as offering the richest pasturage. For alliances and derivation of *cymmyr*, see ABER.] The name given to themselves by the Welsh. In its wider application the term is often applied to that portion of the Celtic race which appears to have at one time occupied all Britain, before they were expelled from the Highlands by the Gadhelic Scots, and from the Lowlands of Scotland and England by the Saxons and Scandinavians, and popularly known as the ancient Britons. Their longer-continued predominance in any locality is traced by the appearance of certain generic words in the place-names. D.

D, in the English alphabet, is the fourth letter and the third consonant. It represents a dental sound formed by placing the tip of the tongue against the root of the upper teeth and then forcing up vocalized breath or voice into the mouth, the soft palate being raised to prevent its escape through the nose. T is formed in the same way except that it is uttered with breath merely, and not with voice. (See T.) When d

follows a whistled, non-vocal, or surd consonant in the same syllable it takes the sound of t, as in *past* *ten* *fat*, &c. This is especially seen in past tense in -ed, the e not being sounded. as, *packed* (-pîkt), *wrapped* (-râpt), *hoped* (-hâpt), *outraged* (-âmrâd), *blinded* (-blînd), &c. It is never silent in English words, except in a rapid utterance of such words as *handkerchief*. D has crept into some English words to which it does

not properly belong, as in *thunder*, *gunder*, *round* (L. *sonitus*), *land*, *And* (a servant), *round* (to whisper); it has disappeared from *gospel* and *answer*. According to Grimm's law in words common to English and to Sanskrit, Greek, Latin, and German, where d appears in English we find *dâ* in Sanskrit, *th* in Greek, *f* in Latin, and *t* in German, thus *th* door - *thür* chamber, *th* above, *th* Jesus, *G. th* - As a name, D represents

churches. (b) *Deans of peculiars*, who have sometimes both jurisdiction and cure of souls, and sometimes jurisdiction only. Of the former class is the dean of Battle, in Sussex; of the latter are the deans of the Arches in London, of Bocking, in Essex, and of Croydon, in Surrey. (c) *Rural deans*, who were originally beneficed clergymen appointed by the bishop to exercise a certain jurisdiction in districts of his diocese remote from his personal superintendence. Their functions, however, have for many years become almost obsolete. He may order insufficient buildings to be taken down, but in other respects his jurisdiction is confined to possessory questions. In most burghs the functions of this officer are now performed by a member of the town-council, elected by the majority of councillors. Decimal (dē-si-māl) n. [Fr. from L. *decimus*, tenth, from *decem*, ten.] Of or pertaining to decimals; numbered or pronounced by decimals, having a tenfold increase or decrease, as, *decimal* notation, a *decimal* coinage. — *Decimal* arithmetic, in a general sense, denotes the common system of arithmetic, in which the decimal or denary scale of numbers is used, or in which the places of the figures change their value in a tenfold proportion, the value being ten times greater for every place more towards the left hand, and ten times less for every place more towards the right. In a more restricted sense, however, the term is applied to decimal fractions. — *Decimal fraction*, a fraction whose denominator is 10, or some number produced by the continued multiplication of 10 as a factor, such as 100, 1000, &c. In the notation of decimals the denominator is usually omitted, and to indicate its value a point is placed to the left of as many figures of the numerator as there are ciphers in the denominator. Should there not be a sufficient number of figures in the numerator, as many ciphers are prefixed as

supply the deficiency. Thus $\frac{1}{10}$, $\frac{1}{100}$, $\frac{1}{1000}$, or $\frac{1}{10}$ are decimals, and are usually written 7, 38, 008, 75, &c. From the notation of decimals it is evident that the figure immediately following the decimal point denotes tenths, the next figure hundredths, the third thousandths, &c. Hence, the values of figures in decimals, as well as in whole numbers, are increased in a tenfold ratio by removing them one place towards the left hand, and diminished in the same ratio by removing them one place to the right; and hence, also, all operations in decimals are performed in exactly the same manner as those in whole numbers, due attention being paid to the position of the separating point. — *Decimal measure*, a measure the unit of which is divided into ten equal parts. — *Decimal system*, see METRIC.

In arch. the second style of pointed architecture, in use in Britain from the end of the thirteenth to the beginning of the fifteenth century, when it passed into the Perpendicular. It is distinguished from the Early English, from which it was developed, by the more flowing or wavy lines of its tracery, especially of its windows, by the more graceful combinations of its foliage, by the greater richness of the decorations of the capitals of its columns, and of the mouldings of its doorways and niches, finials, &c., and generally by a style of ornamentation more profuse and naturalistic, though probably somewhat florid. The Decorated style has been divided into two periods, viz. the *Early* or *Geometrical* Decorated period, in which geometrical figures are largely introduced, and the *Decorated* style proper, in which the peculiar characteristics of the style are exhibited. This latter period has left us the finest monuments of British architecture.

A brief and precise description of a thing by its properties; an explanation of the signification of a word or term, or of what a word is understood to express; as, a *definition* of wit, or of a circle. Logicians distinguish definitions into *nominal* and *real*. A nominal definition explains the meaning of a term by some equivalent word or expression supposed to be better known. A real definition explains the nature of the thing. A real definition is again *accidental*, or a description of the accidents, as causes, properties, effects, &c.; or *essential*, which explains the constituent parts of the essence or nature of the thing. An essential definition is, moreover, *metaphysical* or *logical*, defining 'by the genus and difference,' as it is called; as, for example, 'a plant is an organized being, destitute of sensation,' where the part first of the definition states the genus (organized being), and the latter the difference (destitute of sensation); or *physical*, when it distinguishes the physical parts of the essence; thus, a plant is distinguished by the leaves, stalk, root, &c. A strictly accurate definition can be given of only a few objects. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined.

Definitely (dê-fîn-it-l), adv. In a definite manner.

Definition (dê-fîn-î-shon), n. [*L. definitio*, *definitio*, a limiting, a defining—*definitio*, *definitum*. See DEFINE.] 1. The act of defining, determining, distinguishing, explaining, or establishing the signification of. 'Definition being nothing but making another understand by words what the term defined stands for.' *Locke*.—2. A strictly accurate definition can be given of only a few objects. The most simple things are the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined.

Aldrich, having given as an instance of a *nominal definition* the absurd one of 'homo, qui ex humo,' has led some to conclude that the *nominal definition* must be founded on the etymology; or at least that such was his meaning. But that it was not, is sufficiently plain from the circumstance that Watts (from whose work his is almost entirely abridged) expressly says the contrary. . . . It is plain that the etymology of a term has nothing to do with any logical consideration of it. *Whately*.

Definitive (dê-fîn-it-iv), n. In gram. a term applied to a word used to define or limit

the extent of the signification of an appellative or common noun. Such are the Greek article *ho, he, to*; the Latin demonstrative *hic, ille, ipse*; *the, this, and that* in English; *le, la, les* in French; *il, la, lo* in Italian. Thus, *tree* is an appellative or common noun; *the tree, this tree, that tree* designate a particular tree, determinate or known. *Homo* signifies man; *hic homo, ille homo*, a particular man, &c. But in some languages the definitives have lost their original use in a great degree, as in the Greek and French. Thus, '*La force de la vertu*' must be rendered in English '*the strength of virtue*,' not '*the strength of the virtue*.' The first *la* is a definitive; the last has no definitive effect.

Comp. *damages* in its legal sense. Others trace Fr. *frais* to L.L. *fredum*, a fine for breaking the peace, from G. *friede*, peace, but with less probability.] 1. To pay; to discharge, as cost or expense; to bear, as charge, cost, or expense. It is followed chiefly by *expenses*, *charges*, or *cost*; as, the acquisitions of war seldom *defray* the *expenses*; the profits of a voyage will not always *defray* the cost of the first outfit.—2.† To satisfy; to appease.

The word *disfidare* seems originally to have signified to dissolve the bond of allegiance, as between the lord and his vassal; opposed to *affidare*. Hence it came to be used for the denunciation of enmity and of war. Hence, to challenge. 1. I once again

Defy thee to the trial by mortal fight. Milton.

2. To dare; to brave; to offer to hazard a conflict by manifesting a contempt of opposition, attack, or hostile force; as, to *defy* the arguments of an opponent; to *defy* the power of the magistrate.

are of any circle intercepted between the lines which contain the angle, the angular point being the centre of the circle. Thus we say an angle of 90°, or of 45° 30'. It is also usual to say that a star is elevated so many degrees above the horizon, or declines so many degrees from the equator, or such a town is situated in so many degrees of latitude or longitude. The length of a degree depends upon the radius of the circle of the circumference of which it is a part, the length being greater the greater the length of the radius. Hence, the length of a degree of longitude is greatest at the equator, and diminishes continually towards the poles. Under the equator a degree of longitude contains 60 geographical, and 60 statute miles. The degrees of latitude are found to increase in length from the equator to the poles, owing to the figure of the earth. — 7 In *alg.* a term applied to equations, to show what is the highest power under which the unknown quantity appears, thus, if the index of the highest power of the unknown quantity be 3 or 4, the equation is respectively of the 3d or 4th degree. — 8 In *music*, an interval of sound, marked by a line on the scale. — 9. In *arith.* three figures taken together in numeration, thus, the number 270,000 consists of two degrees. 10. A division, space, or interval, marked on a mathematical, meteorological, or other instrument, as on a thermometer or barometer. 11. In universities, a mark of distinction conferred on students, members, or distinguished strangers, as a testimony of proficiency in arts and sciences, or as a mark of respect, giving them a kind of rank, and entitling them to certain privileges. Degrees are much the same in all universities. The degrees are bachelor, master, and doctor, as, bachelor of arts, divinity, or laws, master of arts, master in surgery, doctor of divinity, laws, medicine, &c. &c. — By *degrees*, also by step, gradually, by little and little, by moderate advancement. — To a degree, to an extreme, accordingly, as, proud to a degree.

The relative quantities of matter in bodies are known by their gravity or weight, and when a body, mass, or quantity of matter is spoken of, its weight or gravity is always understood, that being the proper measure of the density or quantity of matter. The weights of different bodies, of equal bulk, indicate their relative densities.
